Source commit: c2103b6090c8

Pack generated: 6 October 2026

AssetFlow device intelligence sources

Updated: 5 October 2026

AssetFlow now uses a layered lookup rather than relying on one public search engine. Exact identifiers and official/vendor data rank above broad encyclopaedia matches.

Sources

1. DubboEwaste verified catalogue / AssetFlow local records — first choice for known models, aliases and identifiers.
2. Open Icecat — free product data for sponsoring brands; best for GTIN/EAN/UPC and explicit brand + manufacturer part number. AssetFlow supports GTIN and explicit MPN:/SKU:/PART: searches. Uses ICECAT_USERNAME when configured, otherwise the public openIccat-live identity for compatible Open Icecat requests.
3. Google Play supported-device catalogue — public Google device CSV; useful for Android retail branding, marketing names, device codenames and model codes.
4. Lenovo PSREF — official Lenovo Product Specifications Reference; AssetFlow resolves official PSREF product pages for Lenovo family verification.
5. FCC Equipment Authorization System — explicit FCC ID lookups through the official OET Laboratory API.
6. PCI ID Repository — explicit PCI vendor/device ID lookup for components.
7. USB ID Repository — explicit USB VID/PID lookup for peripherals/components.
8. Linux Vendor Firmware Service / fwupd metadata — explicit LVFS/GUID lookup for firmware-supported hardware evidence.
9. Wikidata — structured public fallback.
10. Wikipedia — last-resort research lead only.

Useful search forms

- GTIN 0194253405605
- MPN: 28M88AV with a manufacturer name in the same query
- FCC ID BCG-E8431A
- PCI:8086:15be or VEN_8086&DEV_15BE
- USB:046d:c534 or VID_046D&PID_C534
- LVFS:<GUID>

Ranking rules

- Exact local model / alias / identifier: highest.
- Exact GTIN, brand+MPN, Google model/device code, FCC ID, PCI ID or USB ID: high.

- Official Lenovo PSREF page: high for family identity.
- LVFS metadata: strong supporting hardware/firmware evidence.
- Wikidata: secondary research lead.
- Wikipedia: lowest public-data priority.
- Entered text remains available as an explicitly unverified fallback rather than silently substituting a generic family.

Autofill safety

A selected candidate can autofill manufacturer, model and category, but does not prove ownership, serial identity, lock state, condition, support status or sanitisation suitability.

Retail GTIN/EAN/UPC codes identify a product/SKU, not a unique physical device. Serial/IMEI remains separate.

PCI/USB IDs usually identify components rather than the host computer. Operators should only choose them as the asset model when receiving that component as the asset itself.

External dependencies and limits

- Open Icecat works best with a dedicated free Open Icecat account supplied through ICECAT_USERNAME; no paid subscription is required for Open Icecat-covered brands.
- PSREF has no documented general-purpose public search API, so AssetFlow uses official product-page resolution rather than an undocumented private endpoint.
- Google's public supported-device CSV is excellent for identity, but richer RAM/SoC/GPU/display/SDK columns come from Play Console exports. A future import can add those fields if such an export is supplied.
- LVFS metadata is queried only for explicit LVFS/GUID searches because the firmware catalogue is large.
