Pack generated: 6 October 2026

Master findings from all Dubbo eWaste chats and repo research

Consolidated: 2 October 2026 (AEST)

Purpose: preserve the important findings, decisions, corrections and unresolved questions developed across the user's Dubbo eWaste conversations, while linking to the detailed research files already in this repository.

This is a synthesis, not a replacement for the source-led deep dives. Where a specialised file contains newer evidence, the newer dated finding wins.

For the historical/provenance layer — including the December 2024 donated-computer prehistory, the 10 laptops donated by Bendigo E-Waste on 4 September 2025, DadLAN's reuse role, earlier refurb economics and how the idea moved from Bendigo to Dubbo — see PROJECT-HISTORY-ALL-CHATS.md (PROJECT-HISTORY-ALL-CHATS.md).

Privacy rule

This repository is public.

Project-relevant findings from prior chats are preserved here, but private household identifiers, exact residential cadastral details and unrelated personal/family information are intentionally not reproduced. The proposed residential site is referred to only as the proposed home site.

1. The overall conclusion after all research

The project has changed substantially from the original idea of "an e-waste business".

The strongest evidence now supports this model:

Dubbo eWaste should be a small regional IT asset recovery / refurbishment service that captures useful technology before it enters an end-of-life recycling stream.

The core workflow is:

source equipment

→ prove authority/ownership

→ assign asset/serial record

→ safety triage

→ secure data sanitisation

→ test and grade

- reuse as-is where possible
- repair/refurbish where economic
- redeploy / resell / donate
- harvest useful parts if whole-device reuse fails
- send only the genuine end-of-life remainder to a verified recycling route.

That is materially different from:

"open a place where people dump old electronics."

Dubbo and surrounding towns already have multiple ways for residents to dispose of or hand over unwanted electronics. The unresolved commercial opportunity is reuse before destruction.

2. Top 10 takeaways from the whole project

1. Reuse before recycling is the central opportunity

Council, Officeworks, AMR and regional/NTCRS routes already solve much of the disposal problem.

The gap is earlier:

identify useful device → protect data → repair/refurbish → recover whole-device value → recycle last.

Sircel, PonyUp for Good, The Reconnect Project, Compnow, WorkVentures and the National Device Bank all independently reinforce that hierarchy.

Relevant files:

- SIRCEL-ITAD-REUSE-MODEL.md (SIRCEL-ITAD-REUSE-MODEL.md)
- REUSE-MODELS-PONYUP-RECONNECT-LAPTOP-INITIATIVE.md
(REUSE-MODELS-PONYUP-RECONNECT-LAPTOP-INITIATIVE.md)
- TECHCOLLECT-REUSE-DEEP-DIVE.md (TECHCOLLECT-REUSE-DEEP-DIVE.md)

2. Triage is probably the highest-value operation in the whole business

A functioning business laptop can still have hundreds of dollars of use/resale value.

Once it enters a normal end-of-life recycling stream, that whole-device value can disappear and the machine becomes:

- metal;
- plastic;
- glass;
- PCB/precious-metal feedstock;
- battery stream;
- residual material.

TechCollect is especially explicit: equipment surrendered into its normal recycling stream is not sold as second-hand equipment for reuse. It tells owners to divert good equipment to family, friends or charity before surrendering it.

Dubbo eWaste's most valuable decision may therefore be:

"Is this actually end-of-life?"

before anyone puts it in an e-waste cage.

3. Good corporate fleets are a better supply source than random household e-waste

Compnow, PonyUp and WorkVentures all show the operational advantages of fleet-refresh equipment.

Ten similar ex-business laptops are usually easier to:

- identify;
- serialise;
- wipe;
- test;
- repair;
- source chargers/parts for;
- image/configure;
- sell or donate;

than ten unrelated household devices in unknown condition.

That shifts the preferred upstream targets toward:

- businesses;
- schools;
- professional offices;
- MSP/IT providers;
- government/community organisations;
- organisations refreshing fleets.

Household intake can still exist, but it should remain selective.

4. Data security can be a major commercial differentiator

Business clients do not only want equipment removed.

They may need evidence of:

- chain of custody;
- serial numbers;
- secure sanitisation;

- verification;
- failed-erase escalation;
- final asset outcome.

Mature ITAD operators such as Sircel and WorkVentures use Blancco and issue auditable records/certificates.

Dubbo eWaste should begin with accurate wording:

documented media sanitisation / secure data erasure

and only use stronger "certified destruction" language if a genuinely certified process/provider supports it.

The long-term high-value business service is:

collection → asset inventory → secure erase → test/grade → value recovery → final-outcome report.

5. Commercial resale and social reuse can support each other

Good360/Compnow and the National Device Bank show that social reuse does not require every valuable computer to be donated.

Higher-value stock can be:

- resold;
- bought back;
- remarketed;
- redeployed;

and that value can help pay for:

- wiping;
- repairs;
- chargers/batteries;
- logistics;
- lower-value social devices;
- connectivity/support.

A mature Dubbo model could therefore have:

- commercial reuse stream
- social reuse stream
- parts stream
- recycling stream

instead of choosing between "business" and "charity".

6. "We take e-waste" is not enough of a Dubbo value proposition

Dubbo already has:

- Council household e-waste services;
- Officeworks technology trade-in/recycling channels;
- Australian Metal Recycling;
- repair/refurbished-device retailers;
- second-hand electronics channels;
- regional NetWaste / NTCRS pathways.

So the proposition should not be:

"Dubbo finally has somewhere to take an old computer."

A stronger proposition is:

"Before you recycle old IT, we determine what still has useful value, protect the data, reuse what is viable and document what happened to the remainder."

7. The biggest startup barrier is planning/legal classification, not EPA tonnage

A 20-30 device pilot is nowhere near the major NSW EPA licensing thresholds for scheduled waste facilities.

But being below an EPA threshold does not create planning permission.

The unresolved questions are:

- is the activity a low-impact home business?
- a home industry?
- a goods repair and reuse premises?
- a waste/resource activity?
- does the proposed property/lease permit the actual activity?

The repo deliberately narrows Phase 0 to make a home-business classification more defensible:

- <30 m²;
- one resident operator;
- pre-approved intake;
- no unattended public bin;
- no outdoor stockpile;
- low traffic;
- no industrial shredding;
- online sales;
- no walk-in retail showroom.

Council still needs to answer the classification in writing.

8. The right launch is tiny, selective and reversible

The cheapest defensible pilot is not a warehouse.

It is:

- selective intake;
- Tuesday/Saturday by appointment/pre-approval;
- no general public dumping;
- only items with a known exit route;
- no loose or damaged lithium batteries;
- no CRTs initially;
- physical shelf limits;
- low stock;
- online resale;
- measured outcomes.

This closely matches the real early sequence behind Bendigo E-Waste:

technical experience → own equipment → friends/family → controlled activity → formalisation → warehouse later.

Copy the growth sequence, not the current mature operation.

9. The downstream chain remains surprisingly opaque

The project now knows a lot about what legitimate electronics recycling can look like.

Examples:

- Parkes Shire → Sircel is directly evidenced.
- historical regional NetWaste material described Sims St Marys shredding.
- TechCollect currently uses ACE Recycling Group and Sircel as NSW recyclers.
- Coonamble documented a 2025 route to Matthews Metals Dubbo.

But the key local question remains unresolved:

After AMR Dubbo accepts e-waste, what exact physical facility receives it next?

No defensible public evidence yet proves:

- AMR Dubbo → Sircel;
- AMR Dubbo → ACE;
- AMR Dubbo → Sims;
- AMR Dubbo → Rutherford;
- AMR Dubbo → TechCollect.

That must remain marked unknown until a written answer, transport document, certificate or contract closes the chain.

10. The project has reached the point where pilot data matters more than generic research

Many web questions are now exhausted.

The next major business unknowns are empirical:

- how much good equipment is actually available locally?
- what percentage is reusable?
- how much repair time is required?
- what does each device sell for?
- how quickly does it sell?
- how many become liabilities?
- how much does downstream recycling cost?
- what is gross margin per labour hour?

The pilot tracker should determine whether the model is worth scaling.

3. Officeworks — exact role in the Dubbo e-waste ecosystem

This point caused understandable confusion in chat and should be recorded precisely.

What Officeworks has to do with e-waste

Officeworks is not being treated as an industrial e-waste processor in Dubbo.

It is relevant because it provides an existing consumer technology handover channel.

Officeworks currently operates:

Tech Trade-in

Eligible devices can be traded for value such as an Officeworks gift card.

Relevant categories include selected:

- laptops;
- phones;
- tablets;
- smart devices;
- consoles and other eligible technology.

Suitable equipment can therefore be diverted toward another owner/reuse route rather than simply disposed of.

Bring it Back / technology recycling

Officeworks also accepts selected unwanted technology for recycling through its recycling program.

Nationally advertised categories include various:

- computers/laptops;
- phones;
- chargers/cables;
- storage devices;
- keyboards/mice;
- consoles/controllers;
- networking devices;
- other approved streams.

Officeworks stopped in-store battery collection in February 2024.

What the Dubbo store represents

Officeworks Dubbo is at 10 Erskine Street.

Its existence means a Dubbo resident already has a retail channel where at least some unwanted technology can be:

- traded in;
- or handed into a recycling program.

It does not mean:

- Officeworks Dubbo has an industrial dismantling line;
- the Dubbo store itself shreds e-waste;
- every category on the national program is necessarily accepted locally without checking;
- Officeworks is equivalent to AMR/Sircel/ACE as a processor.

Correct wording for this repo

Use:

Officeworks is an existing retail trade-in / technology collection channel and disposal substitute for some Dubbo households. It is not being described as the local downstream recycler.

That distinction is important.

Detailed market file:

- BACKLOG-17-20-MARKET-COST-TAX.md (BACKLOG-17-20-MARKET-COST-TAX.md)

4. Phase 0 operating model preserved from prior chats

The current Phase 0 design is intentionally narrow.

Intake

- Tuesday and Saturday only.
- Pre-screen before arrival.
- No unattended dumping.
- No public "leave it at the gate" pile.
- Rejected items leave with the person who brought them.
- No walk-in retail showroom.
- Sales principally online.
- Keep total operating footprint <30 m² if relying on home-business pathway.

Preferred equipment

Priority:

- business-class laptops;
- quality consumer laptops;
- desktops / mini PCs;
- Windows 11-capable equipment;
- Macs with Activation Lock removed;
- useful monitors;
- selected phones/tablets with locks removed;
- useful PC components;
- selected consoles/network equipment;
- selected flat-screen TVs only by prior approval.

Refuse / avoid initially

- CRT TVs/monitors;
- loose lithium batteries;
- swollen/damaged/wet/fire-affected batteries/devices;
- e-bike/e-scooter batteries;
- random low-value bulk e-waste;
- cracked-panel TVs without a known profitable parts route;
- unresolved Apple/Google/MDM/Autopilot locks;
- suspicious provenance;
- contaminated/pest-infested electronics;
- broad whitegoods;
- anything with no identified exit route.

Storage principle

Every category gets a physical capacity.

Shelf full = pause intake.

No miscellaneous pile.

5. Planning, lease and property findings from all chats

Planning

The strongest public planning evidence suggests the proposed site is likely in an R2 Low Density Residential setting, but the repo deliberately retains one authoritative property-specific confirmation step.

If R2 is confirmed:

- home business/home industry may be permissible subject to applicable controls;
- a principal goods repair and reuse premises or waste/resource facility is a different and potentially prohibited/problematic classification.

The exact classification depends on the actual operation, not the business name.

Lease

Review of the current residential tenancy agreement found no blanket clause simply saying:

"no business"

but there are important restrictions.

The lease review found:

- illegal use/nuisance/neighbour-impact restrictions;
- a garage/car-space clause restricting its use to vehicle parking rather than general storage;
- storage-area wording stating the landlord does not warrant fitness, ventilation, security or watertightness.

This means:

planning permission and lease permission are separate gates.

Shed condition

Prior tenancy evidence documented water/moisture/mould concerns.

That matters directly to the business because a damp shed is a poor place to store:

- valuable stock;

- unwiped client drives;
- PCs and PCBs;
- chargers/batteries;
- cardboard packaging.

Current repo rule:

Do not store valuable resale stock or unwiped customer/business equipment there until the workspace is demonstrably dry, secure and suitable.

Detailed files:

- PHASE-0-OPERATING-BLUEPRINT.md (PHASE-0-OPERATING-BLUEPRINT.md)
- BACKLOG-01-05-PLANNING-LEGAL.md (BACKLOG-01-05-PLANNING-LEGAL.md)

6. Second-hand dealer / ownership issue

Electronic goods are prescribed second-hand goods under NSW guidance.

A second-hand dealer licence can therefore become relevant.

However current Fair Trading guidance also says a licence is not required to:

engage in recycling and rubbish collection programs.

The unresolved question is whether this exact activity:

collect free unwanted electronics → securely wipe → refurbish viable equipment → resell it → recycle the remainder

qualifies for that exemption.

This must not be guessed.

If a licence applies, issues include:

- supplier identity;
- ownership statement;
- police reporting;
- electronic records;
- 14-day holding period;
- rule that regulated goods must not be altered during the hold.

A key unanswered sub-question is whether:

- wiping;
- opening;
- RAM/SSD replacement;

- repair;
- parts harvesting;

counts as prohibited alteration during that period.

Current rule:

Get Fair Trading's answer in writing before the operating workflow depends on an exemption.

7. Data sanitisation findings

The repo's data approach has matured from "wipe the disk" into a real media-sanitisation program.

Standards

Current research now refers to:

- NIST SP 800-88 Rev. 2 (2025);
- current ASD/ACSC ISM media guidance;
- IEEE 2883 where relevant;
- platform-supported cryptographic erase on modern Apple hardware.

Operational principle

For every data-bearing asset record:

- device serial;
- drive/media serial if accessible;
- media type/capacity;
- selected sanitisation method;
- tool/version;
- start/end;
- verification result;
- PASS / FAIL / DESTROY;
- final route.

If sanitisation cannot be reliably completed/verified:

do not sell the storage medium with unknown data.

Use a verified destruction route or retain/remove the media.

Wording

Use:

until independent certification/accreditation supports stronger language.

8. Lithium, WHS and workshop safety

Phase 0 should not become a battery collection business.

Key preserved rules:

- reject loose lithium batteries;
- reject swollen, punctured, leaking, wet, fire-affected or overheating battery devices;
- never charge questionable batteries;
- no unattended/overnight charging;
- compatible chargers only;
- non-combustible charging/testing area;
- separate damaged-battery emergency path;
- do not assume a generic metal battery bin solves the hazard;
- do not post damaged/recalled lithium devices.

From 1 July 2026, NSW WHS Codes of Practice have elevated significance as minimum performance standards expected of a PCBU.

Detailed file:

- BACKLOG-21-25-COMPLIANCE-DATA-SAFETY.md (BACKLOG-21-25-COMPLIANCE-DATA-SAFETY.md)

9. What happens to e-waste after disposal

Council / regional

NetWaste currently says Sims Metal Management collects e-waste from the majority of NetWaste member councils, while some councils have individual arrangements.

Current/known routes include:

- Parkes → Sircel (direct Council evidence);
- historical regional e-waste → Sims St Marys shredding (historical contract evidence);
- Coonamble → Matthews Dubbo in 2025 (Council evidence);
- Narromine has used Sircel/Parkes in regional activity;
- Mudgee has a visible reuse-oriented Tip Shop route.

But exact current council-by-council routing remains incomplete.

Industrial processing

A proper end-of-life processor may:

- weigh/track loads;
- remove batteries;
- triage for reuse;
- dismantle;
- shred mechanically;
- separate steel/aluminium/copper;
- separate PCBs/precious-metal fractions;
- separate plastics and glass;
- send fractions to specialist refiners/processors;
- landfill unavoidable residuals.

Real Australian NTCRS annual reporting shows that "recycled" does not mean 100% of the device becomes a new product. High recovery rates still include residual landfill/downstream losses.

Detailed files:

- WHAT-HAPPENS-TO-EWASTE.md (WHAT-HAPPENS-TO-EWASTE.md)
- REGIONAL-EWASTE-PATHWAYS.md (REGIONAL-EWASTE-PATHWAYS.md)

10. Australian Metal Recycling / Matthews / InfraBuild findings

The current Dubbo yard at 34 Mountbatten Drive is operated by:

Scrap Metal Services Pty Ltd / Australian Metal Recycling (AMR)

and AMR publicly describes the Dubbo yard as formerly Matthews Metal Management.

InfraBuild/OneSteel material and legacy Matthews naming remain online, which initially caused confusion.

Current research supports:

- AMR/Scrap Metal Services and InfraBuild/OneSteel are separate legal/business operators;
- AMR currently advertises e-waste/electrical-waste acceptance;
- AMR publicly lists computers/laptops, monitors, smart devices and printers/scanners;
- AMR's lithium-ion exclusion creates a significant ambiguity for modern laptops/phones/tablets.

Still not publicly proven:

- AMR Dubbo's first downstream e-waste processor;
- current NTCRS/co-regulator connection;
- AS 5377 recycler in the chain;
- whether it offers serialised HDD/SSD destruction;
- how embedded lithium batteries are handled;

- exact CRT rules;
- exact commercial limits/fees/certificates.

Do not state a named downstream processor until AMR or another authoritative source confirms it.

Detailed files:

- MATTHEWS-INFRABUILD-AMR.md (MATTHEWS-INFRABUILD-AMR.md)
- AMR-DUBBO-DOWNSTREAM-FORENSIC.md (AMR-DUBBO-DOWNSTREAM-FORENSIC.md)

11. TechCollect / ANZRP lesson

TechCollect is primarily the recycling back end, not the reuse model to copy.

Important finding:

Once equipment enters the normal TechCollect recycling stream, TechCollect says it is recycled in Australia and not sold second-hand for reuse.

Good equipment should be diverted before formal surrender.

ANZRP separately supports upstream reuse via:

- PonyUp for Good;
- The Reconnect Project;
- The Laptop Initiative.

This creates the best conceptual model for Dubbo:

local reuse-first operator → send failures into an approved recycling back end.

Not:

put everything into a recycling cage and hope someone rescues the good items later.

12. Sircel lesson

Sircel provided the clearest industrial example of a reuse gate before destruction.

Its published model includes:

- secure collection/logistics;
- unique load tracking;
- triage;
- reuse identification;
- Blancco data sanitisation;
- hardware testing;

- cleaning/refurbishment;
- charity / broker / client redeployment;
- destructive mechanical recycling only for failures.

Sircel reported 2,350 reused assets in FY2023-24.

Its strongest lesson for Dubbo is:

the valuable intellectual process is the decision system before the shredder.

Dubbo does not need industrial shredding machinery.

It can specialise in:

- intake;
- chain of custody;
- data;
- testing;
- repair;
- value recovery;
- final reporting;

and outsource final material recycling.

Important risk:

Sircel entered receivership/voluntary administration in late 2025. Its model is still useful, but Dubbo eWaste should not become operationally dependent on one downstream company without current commercial confirmation.

13. Good360 / Compnow / WorkVentures / Good Things / Device Bank

Good360

Good360 is primarily the matching/distribution layer.

It takes good donated technology into a network where devices can be:

- securely wiped;
- tested;
- refurbished;
- matched to charities/schools;
- distributed to people experiencing digital exclusion.

Good360's public reporting names Sircel among technology/product donors.

It does not prove all Sircel reuse stock goes through Good360.

Compnow

The Good360/Compnow case study provides a concrete refurbishment sequence:

- corporate fleet
- national pickup
- secure wipe
- physical/cosmetic assessment
- hardware tests
- repairs/battery replacement/parts matching
- OS reinstall
- source missing chargers
- box/label
- Good360 distribution.

A major lesson:

deployment-ready means more than "powers on".

National Device Bank

Launched in 2025 by:

- WorkVentures;
- Good360;
- Good Things Australia.

Current standard free-device benchmark includes roughly:

- i5 6th gen+;
- 8 GB+ RAM;
- 128 GB+ SSD;
- Wi-Fi;
- webcam/mic;
- 13.3"+ display.

This is a useful social-reuse quality benchmark.

WorkVentures

WorkVentures provides the technical/ITAD backbone:

- inventory;
- secure collection;

- Blancco/NIST-grade sanitisation;
- certificates;
- grading;
- refurbishment;
- resale/donation;
- R2-style responsible recycling;
- impact reporting.

Good Things Australia

Good Things provides the community/digital-skills layer.

The core social-use lesson is:

device + connectivity + skills + trusted local support

is stronger than simply giving somebody a laptop.

14. Specific Dubbo social-reuse connections

Dubbo Support Center

This is the strongest discovered local bridge.

Good Things Australia has already:

- selected Dubbo Support Center for Digital Sisters;
- awarded Building Digital Skills funding;
- awarded Get Online Week funding.

Dubbo Support Center is now ACNC-registered.

On the currently published NSW Device Bank organisation criteria, it appears to satisfy the organisation-level eligibility requirement to request devices or apply as a digital-literacy provider.

Not publicly confirmed:

- whether it has applied;
- whether it has been selected;
- whether it has received laptops.

Digital Nebula — Dubbo

Good Things also funded Digital Nebula – Dubbo for:

- digital-skills activity;
- Get Online Week.

Its current entity structure does not obviously satisfy the NSW Device Bank's ACNC-charity criterion, so direct eligibility should not be assumed.

Existing local evidence of need

Separate programs already demonstrate useful refurbished-device outcomes in Dubbo.

For example, Services Our Way published a Dubbo recipient using a refurbished laptop for:

- TAFE study;
- coursework;
- employment goals.

DRC/VERTO also ran Laptop to Launch digital-skills activity in Dubbo/Wellington.

This means:

the region already has evidence of both device need and digital-skills support.

The missing piece may be linking local device supply/refurbishment to those existing networks.

15. Bendigo E-Waste lesson

The mature Bendigo business is useful as a benchmark, but its current warehouse is not the right startup template.

The strongest reconstructed sequence is:

nearly 20 years in tech

- Joe processes his own e-waste
- friends/family equipment
- Bendigo E-Waste founded in early 2023
- formal current entity/business-name structure in 2024
- warehouse/shared-site growth
- broader commercial services.

Current Bendigo activities now include:

- broad e-waste intake;
- 24/7 drop-off;
- paid collections;
- commercial bins/pallets;
- repair;
- resale;
- collector network;

- data services;
- warehouse operations.

The transferable lesson is:

grow behind proven supply and demand, not ahead of it.

16. Economics / resale findings

eBay

A major repo correction was required.

The old rough assumption of ~13% eBay fees is not appropriate for the intended tiny Australian pilot under the currently published seller rules.

Eligible Australian sellers with:

- ≤AU\$25,000 eBay sales in the prior 12 months;
- no applicable Pro arrangement;

can currently sell without the old blanket final-value-fee assumption.

Still track:

- listing upgrades;
- promoted listings;
- postage;
- packaging;
- returns;
- international fees;
- actual account-specific charges.

Facebook Marketplace

Primarily a local sale/lead channel in Australia.

Gumtree

Current official Gumtree material has had conflicting fee wording, so the repo correctly treats seller fees as verify at use, not a hard-coded rate.

Pilot economics

The business should measure:

- sale price;

- parts cost;
- labour;
- collection time/km;
- postage/packaging;
- returns;
- recycling cost;
- recycling rebate;
- days in stock.

Important metric:

gross margin per labour hour

rather than headline sale price.

17. Consumer law / resale

Business sales of refurbished equipment remain subject to Australian Consumer Law.

Do not use:

- "as-is";
- "no refunds";
- "no warranty";

as if they erase statutory rights.

Keep:

- serial/asset records;
- test records;
- accurate descriptions;
- known-fault disclosure;
- charger/accessory disclosure;
- buyer/contact details sufficient for product recall where required.

For customer-owned repair work, use the current repair notices before accepting data-bearing products.

18. Known downstream/product-stewardship routes

Potential category-specific back ends include:

NTCRS

Covers major TV/computer categories including:

- TVs;
- laptops/desktops/tablets;
- monitors/projectors;
- printers;
- many computer parts/peripherals.

Approved current co-regulatory arrangements include TechCollect/ANZRP and other approved providers.

Potential future opportunity:

Dubbo eWaste handles reuse/secure triage first, then sends genuine end-of-life NTCRS material into an approved scheme.

MobileMuster

Useful for:

- mobile phones;
- chargers;
- mobile accessories.

Not a general tablet/loose-battery solution.

B-cycle

Requires much more operational control than "put out a battery bin".

Phase 0 should not offer public battery collection.

19. Five biggest unanswered questions

1. Can the exact home-site Phase 0 model operate lawfully and safely?

Still needed:

- definitive Council classification;
- authoritative site planning confirmation;
- lease/landlord position;
- suitable dry/secure workspace;
- insurer acceptance.

This is the main go/no-go gate.

2. Does the NSW second-hand dealer regime apply?

Need written Fair Trading confirmation on:

- recycling/rubbish-program exemption;
- donated/free equipment;
- 14-day hold;
- whether wiping/repair counts as alteration;
- required records/premises notification if licensed.

This can materially change the workflow.

3. Where does the non-reusable material physically go?

Need written downstream answers for:

- AMR Dubbo;
- Council's current post-June-2025 e-waste contractor;
- embedded lithium;
- NTCRS;
- AS 5377;
- CRTs;
- commercial loads;
- certificates/weight records;
- secure storage-media destruction.

The local chain is still not complete enough for strong client claims.

4. Does Dubbo provide enough profitable good equipment?

Only pilot data can answer:

- quality/volume of local supply;
- whole-device reuse rate;
- repair success;
- labour;
- margins;
- shelf time;
- return rate;
- disposal liability.

This determines whether the business exists economically.

5. Which organisations will actually partner?

Promising names exist:

- Dubbo Support Center;
- Good Things Australia;

- WorkVentures;
- Good360;
- National / NSW Device Bank;
- ANZRP / TechCollect;
- Sircel;
- surrounding councils;
- local businesses/MSPs.

But the missing information is:

- who will say yes;
- what role they will allow;
- minimum volume;
- reporting standard;
- liability/warranty;
- collection/logistics;
- commercial terms.

20. Claims the repo must NOT make without new evidence

Do not state:

- AMR Dubbo sends e-waste to Sircel;
- AMR Dubbo sends it to ACE;
- AMR Dubbo sends it to Sims;
- AMR Dubbo sends it to Rutherford;
- AMR Dubbo is a current public TechCollect collection partner;
- Officeworks Dubbo is an industrial recycler;
- every national Officeworks recycling category is definitely accepted at Dubbo without checking;
- every current Dubbo Council e-waste load goes to the historical Matthews/Sims route;
- Sircel sends all reused assets through Good360;
- Compnow refurbishes all Sircel donations;
- Dubbo Support Center is already a Device Bank distribution site;
- Digital Nebula is definitely eligible for the NSW Device Bank;
- the proposed home site is definitively approved for the business;
- the second-hand dealer exemption definitely applies.

These are either unresolved or unsupported.

21. Corrections preserved from earlier chats/research

Where older assumptions conflict, use the newer finding.

Important corrections include:

- do not assume ~13% eBay selling fees for the tiny AU pilot;
- business-name fees updated to current 2026-27 amounts;
- GST threshold confirmed at \$75,000;
- use NIST SP 800-88 Rev. 2, not outdated Rev. 1 language;
- do not market generic internally generated records as "certified data destruction";
- Windows 10 normal support ended in 2025, but current consumer ESU changes the short-term use case for some machines;
- no generic "metal battery bin" solves lithium fire risk;
- no automatic "30 days and an uncollected repair becomes ours" rule;
- customer repair notices matter;
- exact insurance premium cannot be responsibly guessed;
- Bendigo E-Waste's current maturity should not be mistaken for how it started.

See:

- BACKLOG-30-32-OPERATIONS-CORRECTIONS.md (BACKLOG-30-32-OPERATIONS-CORRECTIONS.md)

22. Practical business architecture supported by the research

A mature Dubbo model could ultimately look like:

Stream A — commercial reuse

Business/school/MSP retires devices

- collect/inventory
- ownership transfer
- sanitise
- test/grade
- refurbish
- resale or client redeployment
- client outcome report.

Stream B — social reuse

Useful device with lower commercial value

- sanitise/test/configure
- pass to trusted local charity/community partner
- partner selects recipient
- digital support/connectivity where available.

Stream C — donor parts

Whole device fails economic repair

- harvest useful components
- repair other equipment
- record remaining material.

Stream D — end-of-life

No meaningful whole/parts value

- verified recycler/product-stewardship route
- retain weight/certificate/receipt where available.

This is the strongest combined lesson from:

- Sircel;
- PonyUp;
- Reconnect;
- Compnow;
- WorkVentures;
- Good360;
- TechCollect/ANZRP;
- Bendigo E-Waste.

23. Immediate sequence before public launch

The repo's current best sequence is:

1. Council classification
2. lease / workspace suitability
3. Fair Trading answer
4. insurance
5. verified downstream terms
6. small selective pilot
7. measure 20-30 devices
8. only then widen intake or spend materially

Do not lease a warehouse because the concept feels exciting.

Lease only when:

- supply is consistent;
- stock actually turns;

- labour return is worthwhile;
- storage is the genuine constraint;
- downstream costs are known;
- business pickups are recurring;
- revenue can support fixed overhead.

25. Single-sentence summary

After all the research and all chats, the strongest version of the idea is:

Get useful retired technology before the recycling system does; prove ownership, secure the data, preserve whole-device value, use resale to fund the operation and some social reuse, track what happened to every significant asset, and recycle only the genuine end-of-life remainder.

26. Closest-town official reuse/resale programs

Detailed file:

- DUBBO-WELLINGTON-NARROMINE-TRANGIE-REUSE-PROGRAMS.md
(DUBBO-WELLINGTON-NARROMINE-TRANGIE-REUSE-PROGRAMS.md)

Dubbo

- Whylandra accepts domestic e-waste.
- Council has formally investigated/business-cased reuse shops.
- No current public evidence found of an operating electronics-specific test/wipe/refurbish/resale service at Whylandra.

Wellington

- Wellington Waste Transfer Station accepts domestic e-waste.
- Wellington was explicitly included in Council reuse-shop planning.
- No verified operating electronics refurbishment/resale shop found.

Narromine

- Domestic e-waste is listed as no charge.
- Council uses a low-infrastructure reuse strategy through Garage Sale Trail.
- 2024-25 reporting records 47 garage sales/stalls and 4,231 items reused or sold.
- No verified council-run electronics testing/refurbishment program found.

Trangie

- Current council information supports small-electronics recycling through Trangie Library for categories such as phones and cartridges.
- Full computer/TV e-waste routing is more clearly documented through Narromine than Trangie.
- No verified electronics reuse/resale program found.

The regional pattern is therefore:

reuse is encouraged before disposal, but electronics-specific secure triage after council custody is not visibly established.

27. Why councils have not done more electronics reuse

Detailed file:

- WHY-COUNCIL-ELECTRONICS-REUSE-IS-HARD.md (WHY-COUNCIL-ELECTRONICS-REUSE-IS-HARD.md)

The evidence does not support the idea that councils simply do not value reuse.

Dubbo has planned reuse shops. Narromine promotes resale/reuse. NetWaste's strategy supports circular-economy outcomes.

The barrier is the operational jump from:

waste collection + contracted recycling

to:

IT asset disposition + data security + repair + retail + liability + inventory management.

Major barriers documented across NSW/regional evidence include:

- labour/staffing;
- security;
- illegal dumping/bad donations;
- storage;
- electrical test/tag and product-safety requirements;
- ACL/liability;
- data sanitisation;
- stolen-goods/provenance issues;
- lithium battery/fire risk;
- repair skills;
- customer service/POS;
- warranty/returns;
- unsold inventory;
- electronics depreciation;
- regional transport distances;

- weak economies of scale;
- limited council budgets.

A particularly useful 2026 Cessnock Council report said a reuse shop would require, among other things:

- minimum two staff at all times;
- security/patrols;
- electrical test/tag;
- product-liability management;
- point-of-sale;
- capital works and dedicated structure;
- ongoing compliance.

It described charity/op-shop partnerships as a lower-risk alternative to council-run retail.

This comparative evidence helps explain why a specialist private/social-enterprise reuse layer can make more sense than asking waste-facility staff to become computer refurbishers.

28. PonyUp → SecondBite → Dubbo connection

Detailed file:

- PONYUP-SECONDBITE-DUBBO.md (PONYUP-SECONDBITE-DUBBO.md)

The correct chain is:

PonyUp technology reuse/resale

→ PonyUp profit

→ SecondBite nationally

and separately:

SecondBite / Coles

→ Connecting Community Services in Dubbo

→ local food relief.

Important correction:

PonyUp does not send the computers to SecondBite. It sends a share of profits.

PonyUp says 50% of its profits support SecondBite.

Connecting Community Services is a current SecondBite partner in Dubbo and also provides:

- free computer/internet access;
- basic computer-skills help;
- community/referral support.

No public evidence was found that:

- PonyUp currently processes Dubbo equipment;
- PonyUp donations are earmarked for Dubbo;
- Connecting Community Services receives refurbished devices from PonyUp or SecondBite.

This creates a potential local social-reuse partnership lead, not a current electronics partnership.

29. Latest local strategic conclusion

The local evidence now supports a sharper division of roles:

Councils / NetWaste

Best at:

- mass waste collection;
- facility operation;
- regional procurement;
- statutory compliance;
- material-recycling contracts.

Specialist local reuse operator

Best at:

- deciding whether something is actually end-of-life;
- ownership/provenance;
- secure wipe;
- functional testing;
- repair;
- resale;
- social reuse;
- parts recovery.

Community/digital-inclusion organisations

Best at:

- identifying recipient need;
- providing local support;
- digital-skills assistance;
- outcome follow-up.

A future Dubbo model therefore does not need to replace Council.

It can sit before Council's destructive recycling stream and connect to existing community organisations only where they want that role.

Appendix A — NSW public-school laptops / EDConnect eWaste chain

A major new finding after the original master synthesis is that NSW public-school laptops in Dubbo use a separate Department of Education eWaste pipeline rather than simply entering the Council/Whylandra/AMR household stream.

The current public Department workflow is:

school approval and stocktake → eWaste PowerApp/EDConnect request → contracted vendor schedules a cost-efficient regional collection → vendor collects → vendor data-sanitises all collected hard drives → vendor issues a sanitisation certificate → vendor issues a Settlement Report

The current eWaste application guide explicitly says school-side wiping/destruction of hard drives is no longer required under this collection process; final hard-drive sanitisation is a vendor responsibility.

The public documents do not identify:

- the current dedicated Education eWaste vendor;
- the Dubbo/Orana transport route;
- the first processing warehouse;
- whether useful laptops are tested/graded;
- how many are resold, donated, parted, recycled or destroyed;
- whether the stream feeds the NSW Device Bank.

The broader NSW Government Contract 9826 allows end-user-device disposal methods including:

- reuse through donation or sale;
- reinsertion into a supplier's supply chain;
- recycling through a proven third-party channel.

Current standalone-service suppliers on that panel include ACT Logistics, G1 Asset Management, Greenbox, Lifecycle Plus, Sims Lifecycle Services and WorkVentures. This does not prove which supplier holds Education's dedicated school eWaste contract.

The NSW Device Bank separately demonstrates a reuse-first government model through WorkVentures, with an initial 2026 pilot pool of about 2,800 laptops plus roughly 2,500 more expected during the 12-month term. No public evidence currently proves normal EDConnect school eWaste feeds into that Device Bank.

Strategic consequence for Dubbo eWaste

NSW public schools are not a casual Phase 0 donation source.

The future opportunity would need to be formal:

- approved vendor;
- subcontractor;
- Department-approved regional reuse pilot;
- or integration into an approved Device Bank/reuse program.

The most valuable next evidence is the current Education vendor's Settlement Report and contract details, because those may reveal the true asset outcomes after sanitisation.

Full deep dive:

- NSW-EDUCATION-EWASTE-DUBBO-LAPTOPS.md (NSW-EDUCATION-EWASTE-DUBBO-LAPTOPS.md)

Appendix B — Spotify listening list

A curated Spotify listening list has been added for the concepts that repeatedly matter most to this project:

- reuse before recycling;
- data sanitisation;
- testing/grading;
- IT asset disposition;
- corporate fleet recovery;
- refurbished resale;
- reverse logistics;
- right to repair;
- social/digital-inclusion reuse;
- Australian e-waste processing.

The highest-priority episodes include:

Full ranked list with Spotify links and project-specific relevance notes:

- SPOTIFY-PODCASTS-EWASTE-REUSE-ITAD.md (SPOTIFY-PODCASTS-EWASTE-REUSE-ITAD.md)

30. Fliptech Australia / Dubbo regional hub feasibility

Detailed file:

- FLIPTech-DUBBO-BRANCH-FEASIBILITY.md (FLIPTech-DUBBO-BRANCH-FEASIBILITY.md)

FlipTech Australia is a Brookvale-based secure ITAD/e-waste company rather than simply a generic recycling operator.

Current public evidence supports:

- enterprise IT decommissioning;
- secure collection;
- NIST-aligned data sanitisation;
- certificates and asset reporting;
- hardware buybacks;
- paid/subsidised erasure services;
- refurbishment;
- official resale;
- charitable redistribution;
- downstream recycling.

Historical evidence shows Austin Turpin discussed scaling nationally as early as 2020, and later media described nationwide clients. Current public location material still identifies Brookvale as the primary Fliptech site.

No public evidence was found of:

- a franchise program;
- an authorised regional-partner scheme;
- another permanent Fliptech branch;
- an announced Dubbo site.

Why Dubbo is nevertheless credible

NSW Government currently markets Dubbo itself as an e-waste recycling investment opportunity, citing:

- road/rail/air connectivity;
- regional aggregation;
- industrial land;
- skilled workforce.

Dubbo Regional Council describes a regional service catchment of 125,000+ people, and current local technology/business sources describe 4,500+ businesses.

Local repair/refurbishment businesses exist, but public pages reviewed do not establish a local provider offering the full enterprise-grade Fliptech package of:

- secure fleet collection;
- chain of custody;
- NIST-level erase;
- serialised reporting/certificates;
- hardware buyback/value recovery;
- official resale/donation;
- downstream reporting.

Most evidence-based model

Do not assume the right starting point is a full branch.

The strongest test is:

Fliptech Central West / Orana regional ITAD collection pilot based around Dubbo

Possible progression:

1. scheduled regional collection runs;
2. secure local aggregation;
3. authorised local operator/partner if Fliptech agrees;
4. local sanitisation/triage once standards are proven;
5. permanent full branch only after recurring volume justifies it.

This would directly test the missing commercial variable:

Does regional asset volume justify local people/premises/security, or is Brookvale-based collection still cheaper?

The key next step is a direct conversation with Fliptech using the dedicated questions now in CALL-SCRIPTS.md.

31. Australian ITAD staffing / Dubbo branch shortlist

Detailed file:

- AUSTRALIAN-ITAD-STAFFING-DUBBO-BRANCH-SHORTLIST.md
(AUSTRALIAN-ITAD-STAFFING-DUBBO-BRANCH-SHORTLIST.md)

The earlier broad staffing comparison was deliberately narrowed to organisations with public evidence that a physical Dubbo hub/branch/satellite is worth investigating, rather than merely companies capable of servicing Dubbo remotely.

Staffing correction

Fliptech's current public LinkedIn figure is:

- 11-50 employees

not an exact count of 11.

Retained shortlist

- Fliptech Australia — 11-50; one public site, but historical national ambition and strongest model fit.
- G1 Asset Management — 11-50; multiple secure processing facilities and explicit regional-Australia service.
- Renew IT — 51-200 LinkedIn band; company material has also said 200+ professionals; multiple Australian depots/facilities.
- Greenbox Group — 51-200; repeated branch expansion, four Australian facilities, partner program and historic regional roadshows.
- WV Technologies — 51-200; five-state location footprint and full buyback/refurbish/remarket model.
- Shred-X — 201-500; 11 national facilities, three in NSW, explicit regional NSW coverage and active E-Waste/ITAD growth.

- Iron Mountain / former ACT Logistics — ACT was 51–200 before acquisition; multiple Australian facilities and active Australian/APAC ALM expansion.

Most important finding

G1 is the key staffing comparison.

It sits in the same 11–50 LinkedIn size band as Fliptech yet currently operates processing facilities across Brisbane, Sydney, Canberra and Melbourne and services regional Australia.

That means employee band alone does not rule out a small Fliptech Dubbo satellite.

The bigger determinants are:

- recurring regional contract volume;
- logistics savings;
- resale/recovery value;
- security/compliance costs;
- facility utilisation.

Removed from the branch shortlist

The following remain useful operators/partners/benchmarks, but current public evidence is not strong enough to treat a physical Dubbo branch as a leading thesis:

CirculaTech, Multi R IT, 9R Cycle IT, Tech ReCall, LinkBytes, ITC Asset Management, Excess Technology, EraseIT, Interlink Asset Management, ITSD, Secure Computer Recycling & Disposal, Recycle IT Australia, Enable IT Recycling, Sircel, Lifecycle Plus, WorkVentures, Total Green Recycling, Close the Loop and Sims Lifecycle Services.

Removal does not mean they would refuse work in Dubbo. It means there is not enough branch-pattern evidence to prioritise them for a Dubbo physical-site approach.

32. Dubbo ITAD branch-entry playbook

Detailed file:

- DUBBO-ITAD-BRANCH-ENTRY-PLAYBOOK.md (DUBBO-ITAD-BRANCH-ENTRY-PLAYBOOK.md)

The deeper branch research separates three models:

1. partner / white-label
2. approved satellite / aggregation hub
3. corporate-owned branch

None of the seven shortlisted companies publicly offers a simple purchasable Dubbo franchise.

Best entry ranking — ease + low cost + payoff

1. Greenbox Partner Program

2. G1 white-labelled ITAD
3. Fliptech regional pilot / authorised operator
4. WV Technologies commercial partner
5. Iron Mountain Global Partner + ALM
6. Renew IT regional depot proposal
7. Shred-X corporate branch proposal

Separate physical-branch plausibility ranking

1. Greenbox
2. G1 Asset Management
3. WV Technologies
4. Fliptech
5. Shred-X
6. Renew IT
7. Iron Mountain / ACT

Why Greenbox moved to the top

Greenbox publishes a real partner-onboarding process:

- two-page application;
- 12-month business plan;
- three references;
- three months of credit information;
- mandatory training;
- stated 14-business-day decision target;
- partnership MOU;
- co-branding / white-labelling / direct customer servicing;
- preferred pricing and asset-recovery margin opportunity.

No public partner joining fee was found.

Why G1 is the cheapest operational alternative

G1 already advertises white-labelled ITAD for IT service providers and covers regional NSW.

A Dubbo provider could potentially:

- own the customer relationship;
- sell the ITAD service;
- have G1 perform collection, sanitisation, processing and reporting;
- avoid a warehouse and local Blancco at launch.

No public white-label fee/margin schedule is published.

Current cost benchmark

Public/current components now captured:

- business name: \$47/1 year, if a new name is required;
- NSW second-hand dealer licence, if applicable: \$692/1 year;
- current 190 m² Dubbo industrial rent benchmark: \$395/week + GST, or \$20,540/year + GST;
- low-end small-commercial security benchmark: about \$5,000+;
- current Australian Blancco reseller example: \$982.30 for an SMB Select 50 bundle;
- national minimum wage: \$26.44/hour;
- wage + 12% super floor for one full-time award-free adult: \$58,525.38/year.

Modelled secure-hub baseline:

- \$27,261.30 before insurance, bond, outgoings, utilities, vehicle, racking, tools and labour.

Same model + one minimum-wage FTE:

- \$85,786.68 before those same unknown costs.

These are transparent modelled floors, not quotes.

Strongest next commercial evidence

Do not lease a warehouse yet.

Obtain:

1. Greenbox partner pricing/rulebook;
2. G1 white-label commercial pricing;
3. Fliptech written regional-pilot terms.

Those three documents are the fastest route from public estimates to actual Dubbo economics.

32. Cheapest path to a Dubbo ITAD branch / hub

Detailed file:

- DUBBO-ITAD-BRANCH-PATHWAYS-COSTS-PROCESS.md (DUBBO-ITAD-BRANCH-PATHWAYS-COSTS-PROCESS.md)

The branch research now distinguishes three different models:

1. white-label / sales front end — no local custody or processing;
2. secure collection / consolidation hub — local custody but central backend processing;
3. full processing branch — local sanitisation, testing, refurbishment and remarketing preparation.

Best pathway ranking for a local operator

1. G1 Asset Management — easiest and lowest capital because G1 explicitly offers white-labelled ITAD to IT service providers.

2. Greenbox — strongest formal partner program, including application, 12-month business plan, references, credit information, mandatory training and preferred pricing.
3. Fliptech — strongest conceptual fit and potentially highest entrepreneurial upside, but no public partner/franchise program exists; requires a negotiated regional pilot.
4. WV Technologies — six hubs/five states; likely company-backed regional hub rather than independently opened branch.
5. Renew IT — mature depot/facility model; likely corporate-led.
6. Shred-X — 11 national facilities and regional NSW coverage, but a Dubbo site would likely need broader secure-destruction route economics.
7. Iron Mountain / ACT — strongest corporate capability but least independently openable.

Current public cost floors

Using current public prices:

- No-premises market test: ABN \$0; business name \$47/year if needed.
- New company: \$636 registration + \$47 business name = \$683 upfront, plus \$342 annual company review.
- 18 m² secure business-storage example: \$125/month incl. GST.
- 32–36 m² business-storage example: \$220/month incl. GST.
- NSW second-hand dealer 1-year licence, if required: \$692.
- Current 200 m² Dubbo industrial listing: \$395/week + GST = \$22,594/year incl. GST.
- Current Blancco SMB Select 50 listing: \$982.30.
- Owner-operated processing-hub known public-price subtotal: \$24,315.30/year, before insurance, outgoings, bond, power, fitout, freight and vehicle.
- Hub + 20-hour casual legal wage/super floor: \$62,811.94/year before the same missing costs.
- Hub + one full-time legal wage/super floor: \$82,840.68/year before the same missing costs.

These are arithmetic from public prices, not all-in quotes.

Strategic conclusion

The strongest risk-adjusted sequence is:

G1 white-label or Greenbox partner → win Dubbo accounts → prove volume → secure aggregation → local processing → branded branch only when the numbers justify it.

The exact profit still cannot be calculated because none of the shortlisted companies publishes:

- reseller margin;
- referral commission;
- branch-manager pay;
- regional exclusivity terms;
- buyback/revenue-share arrangements.

Those need written commercial quotes.
