Sircel ITAD / reuse-first model — deep dive for Dubbo E-Waste

Research date: 2 October 2026 (AEST)

This note focuses on the most strategically relevant part of Sircel's model for Dubbo E-Waste: triage first, reuse second, recycling only for genuinely end-of-life equipment.

The key insight is that Sircel does not treat every old computer as "waste". It inserts a decision point before destruction:

Is this asset still useful enough to preserve as a complete device?

If yes, it enters an IT asset disposition / reuse pathway.

If no, it moves into material recycling.

That distinction is exactly where a small Dubbo operation could create value.

1. Sircel's hierarchy: reuse is deliberately before recycling

Sircel's current ITAD page says:

- "The first principle of recycling at Sircel is reuse."
- data-bearing assets are securely erased in preparation for reuse/redeployment;
- assets that cannot be recovered are mechanically recycled;
- reusable end-user assets include laptops, desktop PCs, unlocked mobile devices and tablets;
- suitable assets may be donated to charity or re-sold to an approved broker;
- Sircel says it guarantees fair market value on repurposed end-user computing devices.

Its current process page makes the triage gate explicit:

1. collection and logistics;
2. receipt and tracking;
3. triage;
4. size reduction and separation;
5. recovered-commodity reuse;
6. metals recovery.

At triage, Sircel removes batteries, large plastics, steel and wood, but also specifically identifies devices that are not actually end-of-life. Those are diverted away from the destructive process and into ITAD.

This is not just marketing language. NSW EPA's waste hierarchy independently supports the same ordering: after avoidance/reduction, reuse is preferred to recycling, because reuse avoids the energy and resource costs of processing material back into commodities.

Why this matters

A functioning laptop is worth more economically and environmentally as a functioning laptop than as:

- 1-2 kg of mixed metal/plastic/glass;
- a small PCB fraction;
- a battery;
- a commodity-value hard drive/SSD.

The whole-device value disappears the instant the machine enters a shredder.

For Dubbo E-Waste, triage is therefore the highest-value operation in the entire business.

2. What Sircel actually does at triage

Sircel's current process description says every lot is:

- received at a facility;
- weighed at a weighbridge or pallet scale;
- allocated a unique tracking number;
- triaged before mechanical processing.

At triage Sircel identifies:

A. Reusable / recoverable IT assets

These are routed to its ITAD team.

Examples explicitly named in Sircel material include:

- laptops;
- desktop PCs;
- unlocked phones;
- tablets;
- working hard drives;
- other data-bearing computing equipment.

B. End-of-life devices

These are routed to mechanical processing after batteries and incompatible materials are removed.

C. Hazardous / separately handled items

Batteries are not sent through the main mechanical line. Sircel says batteries are triaged and sent to accredited/certified downstream partners.

D. Other material that needs separation

Sircel specifically names:

- large plastics;
- steel;
- wood;
- batteries.

This shows triage is not a quick "works / doesn't work" check. It serves three purposes at once:

1. reuse identification;
2. process safety;
3. material-routing efficiency.

3. Sircel's reuse pathway in detail

Step 1 — secure collection / chain of custody

Sircel says it provides:

- secure collection and transport;
- chain-of-custody services;
- secure cages/bins for collection;
- unique load tracking;
- audit reporting.

Its council collection page says Sircel can triage e-waste onsite at council events/recovery centres, so unsuitable or incompatible material can be separated before transport.

For Dubbo E-Waste this suggests an important future model:

do triage before valuable devices disappear into a council e-waste cage.

A council/school/business collection event could have separate streams:

- reuse candidate
- parts candidate
- material recycling
- battery/hazardous stream

rather than throwing everything together.

4. Data security is the gate that makes reuse possible

For business and government equipment, reuse is impossible unless the former owner's data risk is solved.

Sircel's solution is Blancco Drive Eraser.

Its current ITAD page says clients can select erasure methods/standards labelled:

- NIST Clear / Purge;
- DoD 5220.22-M / ECE;
- BSI-GS/GSE;
- IEEE 2883-2022.

Correction note (6 Oct 2026): the presence of a "DoD 5220.22-M" option is a vendor/service method label, not evidence that DoD 5220.22-M remains a current sanitisation compliance standard. DubboEwaste should use NIST SP 800-88 Rev. 2 / IEEE 2883 terminology for its own current policy.

It says each erasure is verified and generates a digitally signed data-erasure certificate.

A separate current Sircel booking page is slightly more prescriptive and says all data-bearing assets are erased to IEEE 2883-2022. These two pages are not perfectly aligned, so the safest interpretation is:

- Sircel clearly uses Blancco;
- Sircel clearly issues audit/certificate evidence;
- it supports IEEE 2883-2022 and other recognised standards;
- the exact standard can depend on the engagement/client workflow.

Independent evidence for Blancco

This is not merely Sircel asserting that its software is secure.

Blancco Drive Eraser 7.3.1 received Common Criteria EAL2 certification under Australia's AISEP program in June 2023. The certificate was signed by the Head of the Australian Cyber Security Centre and remains relevant to that evaluated product/version.

Blancco also currently reports ADISA product-assurance certification for:

- NIST SP 800-88;
- IEEE 2883-2022;
- HDD;
- SSD;
- NVMe media.

Blancco's current product material says Drive Eraser supports Clear/Purge methods and digitally signed erasure certificates.

Why the certificate matters

The certificate turns:

"I wiped it"

into something closer to:

"Device serial X / drive serial Y was sanitised using method Z, verification passed, at time/date T."

That is materially more useful to:

- schools;
- councils;
- MSPs;
- medical practices;
- legal firms;
- businesses;
- government.

For Dubbo E-Waste, this is potentially one of the highest-value services you could eventually offer.

5. Sircel does not just wipe devices — it hardware-tests them

Sircel's FAQ states that each computing device:

1. has its data sanitised;
2. receives a data-erasure certificate;
3. undergoes a full hardware test using Blancco Drive Eraser's built-in test module;
4. if it passes Sircel's criteria, is cleaned and reused.

Sircel does not publicly disclose its complete minimum hardware specification or grading matrix, so we should not invent one.

However, its published model establishes the sequence clearly:

data-safe → hardware-tested → condition/viability assessment → reuse or destruction

That is a much better model than:

"it powers on, therefore sell it."

6. What happens to assets that pass

Sircel says suitable assets can go to:

Charity / community reuse

Its ITAD page says passing devices may be donated to charity.

Its FAQ says reused equipment often goes back into commercial use through charity and community organisations.

Approved resale brokers

Sircel says suitable assets may be sold to an approved broker.

Client redeployment

Its pages also refer to reuse or redeployment, meaning a client can potentially reuse its own sanitised assets internally.

Buy-back / value recovery

Sircel advertises:

- fair market value (FMV) for repurposed end-user devices;
- an Agreed Value Buy-Back Scheme for devices meeting minimum specifications.

It does not publicly publish the minimum specifications or buy-back rate card.

That is a meaningful business-model clue. The supplier of the old IT equipment can receive a financial return instead of paying only for disposal.

For Dubbo E-Waste this could eventually become:

- outright purchase;
- free collection;
- revenue share;
- consignment;
- donation;
- trade-in credit;
- zero-cost secure disposal for low-value assets.

7. Hard evidence that Sircel really does reuse devices

Sircel's FY2023-24 ESG Impact Report is the strongest quantitative evidence found.

For July 2023 to June 2024 Sircel reported:

- 1,877 tonnes diverted from landfill;
- 2,350 items reused;
- 202 partners;
- 1,081,422 kg of processed metals output;
- 119,239 kg plastic diversion.

The report specifically says a significant quantity of the laptops and desktop computers Sircel receives are still working.

Its stated sequence was:

receive working laptop/desktop → data erase → distribute for reuse through partners.

The report says Sircel formalised its ITAD reuse-diversion process during FY2023-24, including:

- secure data erasure;
- refurbishment;
- reuse or recycling.

It says the 2,350 assets were processed with Blancco erasure before suitable units were redirected through consumer-facing organisations.

Important transparency limitation

The same ESG report says its visibility ends once reused assets enter the operational control of its reuse partners.

That is useful honesty. Sircel knows:

- what it receives;
- what it wipes;
- what it sends to reuse partners;

but it does not necessarily track the complete second life of every device after transfer.

Dubbo E-Waste could actually improve on this at small scale by maintaining serial-level records through resale/donation.

8. What happens when an asset fails reuse triage

Sircel's ITAD model has a hard fallback:

if it cannot be repurposed, it is securely destroyed and materially recycled.

Sircel says these devices are mechanically reduced to fractions smaller than 1 mm.

Its main recycling line:

1. removes batteries;
2. feeds whole end-of-life devices into mechanical size reduction;
3. separates commodities at multiple stages;
4. reduces material down to approximately 1 mm fractions;
5. uses further metallurgical recovery for metals;
6. directs recovered commodities into manufacturing/reuse markets.

This has an important data-security side effect: once a storage-bearing device has been reduced to sub-millimetre fractions, practical data recovery from the original device is impossible.

But for Dubbo E-Waste, mechanical destruction should be the last option, not the first.

9. The commercial logic behind Sircel's model

Sircel is effectively optimising every incoming asset for its highest remaining value.

A simplified hierarchy is:

Level 1 — whole-device reuse

Highest-value outcome.

Examples:

- laptop;
- desktop;
- tablet;
- unlocked phone.

Revenue/value comes from:

- resale;
- redeployment;
- buy-back;
- charity/social value.

Level 2 — component reuse

If the whole device is not viable, useful parts may still carry more value than raw material.

Examples:

- SSD;
- RAM;
- CPU;
- charger;
- display;
- keyboard;
- GPU;
- working HDD;
- Wi-Fi module.

Sircel's public material emphasises whole-device ITAD more than parts harvesting, so the component-level opportunity may actually be more relevant to Dubbo E-Waste than to Sircel's mass-processing model.

Level 3 — material recovery

When device/component reuse no longer makes sense:

- steel;
- aluminium;
- copper;

- PCBs;
- plastics;
- precious/base metal fractions.

Level 4 — unavoidable treatment/disposal

Only genuine residuals.

This is exactly consistent with the NSW waste hierarchy.

10. Sircel's reuse model is much closer to the proposed Dubbo business than ordinary scrap recycling

The strongest conceptual comparison is not:

Dubbo E-Waste vs AMR

It is:

small-scale local ITAD/refurbisher + regional material recycler

Sircel combines both functions in one group:

- collection;
- triage;
- ITAD;
- data sanitisation;
- asset recovery;
- resale/donation;
- mechanical recycling;
- metals recovery.

Dubbo E-Waste does not need to reproduce the last two expensive industrial stages.

It could specialise in the first five and use a downstream partner for the remainder.

Proposed Dubbo architecture

Businesses / schools / households

↓

Dubbo E-Waste intake

↓

Ownership + serial capture

↓

Triage

↓

Four streams:

A. Reuse

- wipe
- test
- clean
- refurbish
- sell/donate/redeploy

B. Parts

- wipe storage
- harvest/test components
- sell/use parts

C. Recycling

- strip data media if needed
- separate batteries
- send end-of-life material to verified recycler

D. Reject / hazardous

- swollen batteries
- unsafe CRTs
- contaminated material
- unsupported categories
- immediately route to approved specialist

This keeps capital expenditure low while preserving most of the economic opportunity.

11. A practical Dubbo triage system modelled on Sircel

Sircel does not publish its exact grading rules. The following is therefore a proposed Dubbo operating model informed by Sircel's process, not a claim about Sircel's internal SOP.

Gate 0 — ownership / legal intake

Before touching the device:

- supplier identity;
- signed authority/ownership transfer;
- business/school asset disposal authority where required;
- serial number;
- manufacturer/model;
- source;
- received date;
- locked/managed status declared;
- physical condition photographs.

Do not wipe or alter a device until the second-hand dealer-law position and any 14-day hold obligation are resolved.

Gate 1 — safety triage

Immediately separate:

- swollen/punctured/hot batteries;
- leaking cells;
- CRT damage;
- liquid-contaminated equipment;
- burnt devices;
- exposed mains wiring;
- obviously hazardous material.

No charging questionable lithium batteries.

Gate 2 — security / ownership locks

Check:

- BIOS/UEFI passwords;
- BitLocker state;
- Windows Autopilot / Intune;
- Apple Activation Lock;
- Google FRP;
- MDM;
- Computrace/Absolute where relevant;
- domain/enterprise enrollment.

A technically good laptop with an unresolved ownership lock may have zero resale value.

Gate 3 — first power / hardware viability

Record:

- POST/boot;
- CPU;
- RAM;
- storage presence/health;
- display;
- keyboard/trackpad;
- ports;
- Wi-Fi/Bluetooth;
- battery condition;
- charger;

- thermals;
- physical hinges/chassis;
- cameras/audio where relevant.

Gate 4 — market-value test

Ask:

What would this sell for fully tested and cleaned?

Then subtract:

- missing charger;
- SSD/RAM needed;
- battery;
- parts;
- platform fees;
- postage/packaging;
- labour/time;
- warranty/returns risk.

If positive enough: reuse candidate.

If not, ask whether the parts value beats the commodity-recycling value.

Gate 5 — data sanitisation

For equipment chosen for reuse:

- use a defined standard;
- verify the erase;
- retain serial-level evidence;
- generate a certificate/report;
- if erasure cannot be proven, physically destroy or retain the storage rather than selling it with unknown data.

The long-term professional target should look more like Sircel/Blancco's auditable approach than a generic Windows reset.

Gate 6 — refurbishment

Only spend money where the resale margin supports it.

Likely high-value jobs:

- SSD install;
- RAM upgrade;
- battery replacement when economical;
- charger matching;

- OS install;
- cleaning;
- thermal maintenance;
- minor cosmetic repair.

Gate 7 — final disposition

Each serial should end as one of:

- sold;
- donated;
- redeployed;
- used for parts;
- recycled;
- hazardous downstream;
- returned to supplier.

This turns "e-waste collection" into a traceable asset-management service.

12. What Sircel teaches us about business clients

Sircel's ITAD clients are not merely buying disposal.

They are buying a bundle of outcomes:

Security

- chain of custody;
- erasure;
- verification;
- certificates;
- physical destruction fallback.

Financial recovery

- fair-market-value asset recovery;
- buy-back;
- reuse/resale.

Environmental reporting

- kilograms received;
- landfill diversion;
- material streams;
- reuse/recycling outcomes.

Convenience

- cages/bins;

- collection;
- logistics;
- onsite decommissioning.

Auditability

- unique lot tracking;
- reports;
- certificates.

That means Dubbo E-Waste's strongest business pitch may eventually be:

We make old IT safe, useful and accountable.

Not:

We take old computers.

13. The council opportunity is bigger than simple collection

Sircel says it works with local councils through:

- public drop-off events;
- cages/bins at council recovery centres;
- collaboratively designed systems;
- onsite triage.

It says that since 2019 it has worked with more than 19 councils and collected nearly 1,000 tonnes through household events.

Its wider site currently reports work with 80 councils to date, although that number includes more than only e-waste collection events.

Best Dubbo council pilot concept

Instead of asking:

"Can Dubbo E-Waste take the council's e-waste?"

ask:

"Can we pilot a reuse-first triage stream before reusable computers enter the bulk recycling stream?"

A pilot could be:

1. separate cage labelled Potential Reuse — laptops/desktops/tablets only;
2. no damaged/swollen batteries;
3. Council staff do not need to assess value;
4. Dubbo E-Waste collects on an agreed schedule;

5. serials and outcomes logged;
6. secure wipe certificate for data-bearing assets;
7. report back:
 - units received;
 - units reused;
 - units donated;
 - units parted;
 - kg sent to recycling;
 - avoided recycling/destruction count;
 - resale/revenue-share where applicable.

This directly aligns with NSW EPA's reuse-before-recycling hierarchy.

14. Sircel's current corporate situation matters

There is a major due-diligence caveat.

Sircel Limited and related companies entered receivership and voluntary administration on 31 October 2025.

Sircel stated on 17 November 2025 that:

- operations continued across all sites;
- staff were retained;
- licences/accreditations remained in place;
- regulators had been notified.

A June 2026 insolvency report said receivers were still pursuing sale/recapitalisation options after initial bids were deemed unviable. The administrators had recommended winding up if an adjournment was not granted, while further proposals were being explored.

As of this research:

- Sircel's website is active;
- Parkes remains listed as an operating location;
- Parkes Shire's 2025-26 reporting continued to reference Sircel e-waste/shared-agreement work.

Strategic conclusion

Copy the model, not the balance sheet.

The reuse-first / secure-ITAD workflow is highly relevant.

But Dubbo E-Waste should not depend on Sircel as its sole downstream partner without confirming current commercial and insolvency status.

The safer design is:

- Dubbo E-Waste owns its triage/reuse/data process;

- maintain more than one verified downstream recycling option;
- Sircel/Parkes can be investigated as one potential partner;
- AMR/NTCRS/MobileMuster/other certified processors remain alternatives by category.

15. Sircel's certification stack

Sircel's current compliance page lists credentials covering receiving, sorting, dismantling, refurbishment and destruction of electronics including:

- R2v3 at Villawood;
- AS/NZS 5377;
- ISO 45001;
- ISO 9001;
- ISO 14001.

Important scope note:

- Sircel specifically identifies R2v3 at Villawood, 82 Marple Avenue.
- Do not assume every Sircel site independently holds the same R2v3 scope.

R2v3 is particularly relevant because it focuses on:

- electronics reuse/recycling;
- downstream accountability;
- data-bearing asset control;
- final disposition tracking.

Dubbo E-Waste will not need this certification on day one, but it is a useful model for designing records from the beginning.

16. The most useful Sircel metrics for Dubbo E-Waste to copy

Track items, not just kilograms.

Recommended pilot metrics:

Intake

- number of devices;
- source/client;
- device class;
- total weight;
- estimated resale value.

Reuse

- number reused;
- reuse rate by count;

- resale revenue;
- donation count/value;
- average turnaround time;
- repair spend;
- labour time.

Data

- number of data-bearing devices;
- erasure passed;
- erasure failed;
- drives physically destroyed;
- certificates issued.

Parts

- devices parted;
- parts harvested;
- parts sold/reused;
- parts value recovered.

Recycling

- units sent to material recycling;
- kg recycled;
- downstream company;
- receipt/certificate number.

Rejection

- locked;
- hazardous;
- uneconomic;
- physically destroyed;
- unsupported item type.

Financial

- revenue per received device;
- gross margin per reused device;
- average cost per failed device;
- disposal/downstream cost;
- client revenue share.

Sircel's ESG report shows why this matters: weight alone hides reuse value. A 2 kg laptop reused is strategically more interesting than 2 kg of metal recovered.

17. What Sircel does not publicly tell us

These are valuable gaps to ask them directly:

1. What exact hardware tests determine pass/fail?
2. What are the current minimum resale specifications?
3. Are there CPU-generation cutoffs?
4. Minimum RAM/SSD requirements?
5. Maximum acceptable battery wear?
6. Cosmetic grading rules?
7. What faults are economically repaired?
8. Which assets go to charity vs brokers?
9. What percentage of ITAD intake gets reused?
10. Average resale/recovery value per asset?
11. How does the FMV guarantee work?
12. Who carries warranty/consumer-law responsibility after broker resale?
13. Is Parkes itself performing ITAD/data erasure, or are reusable regional devices transferred to a dedicated ITAD location?
14. Does Sircel accept already-triaged reusable laptops from independent collectors/refurbishers?
15. Would Sircel purchase or revenue-share higher-value regional assets rather than shred them?
16. Would Sircel partner with a local Dubbo operator that performs first-pass testing/triage?
17. Can a small regional partner use Sircel's downstream recycling and receive certificates?
18. Is there a minimum pallet/weight/collection size?
19. What current arrangement exists with NetWaste councils?
20. Given the current administration/receivership, what contract entity should a new partner deal with?

18. Questions specifically worth asking James Galera / Sircel ITAD

Sircel publicly identifies James Galera, National IT Asset Disposition Manager, as leading the ITAD team.

The most useful interview would not be about industrial shredders. It would be:

"How do you decide whether an old laptop gets a second life instead of getting destroyed?"

Suggested questions:

1. Walk me through a laptop from truck arrival to resale.
2. At exactly what point is a reuse candidate identified?
3. Who performs the first triage?
4. What data do you capture against the serial number?
5. What hardware tests are mandatory?
6. What minimum specification determines resale?
7. Which faults are repaired?
8. Do you upgrade RAM/SSD/batteries or only clean/test?
9. How do you calculate fair market value?
10. What percentage of incoming laptops are reusable?

11. What ages/models are most often worth saving?
12. Who are the approved brokers?
13. How are charity destinations chosen?
14. How do client revenue-share / buy-back arrangements work?
15. What does the Blancco certificate record?
16. What happens if an erase fails?
17. How do you handle BitLocker/Activation Lock/MDM/Autopilot?
18. Do you remove drives for separate treatment?
19. Can a regional refurbisher perform first-pass triage for Sircel?
20. What would Sircel want from a Dubbo reuse partner?

Those answers could essentially give us the blueprint for Dubbo E-Waste's core operating system.

19. Recommended Dubbo E-Waste positioning after this research

The emerging model is clearer now.

Dubbo E-Waste should not primarily be:

- a tip;
- a scrap yard;
- a place that accumulates random electronics;
- a cheap imitation of a large industrial recycler.

It could be:

a regional reuse-first IT asset recovery service.

Core promise:

1. Identify what still has a useful life.
2. Protect the former owner's data.
3. Recover the maximum practical value.
4. Keep complete devices in use where possible.
5. Recycle only what is genuinely end-of-life.
6. Provide evidence of what happened to every significant asset.

That is much closer to Sircel's ITAD model than to ordinary household e-waste collection.

And it fits a tiny shed pilot far better because triage, testing, wiping, cleaning and resale are low-capital activities compared with mechanical shredding, metals separation and refining.

Bottom line

The most valuable thing Sircel has built is not its shredder.

It is the decision system before the shredder.

That is the part Dubbo E-Waste can realistically copy:

receive → identify → secure data → test → value → refurbish → reuse → parts → recycle last.

Follow-up: what happens after Sircel hands a reused device to a partner?

This is now researched separately in SIRCEL-REUSE-PARTNERS-WHERE-DOES-IT-GO.md (SIRCEL-REUSE-PARTNERS-WHERE-DOES-IT-GO.md).

The strongest named downstream link found is Good360 Australia. Good360's 2024 Annual Report and 2025 Digital Access Report both name Sircel as a product donor in its digital-inclusion work. Good360 then uses refurbishment/distribution partners and a large charity/school network to put devices into real community use.

Documented Good360 end uses include:

- upper-secondary students without their own laptop;
- social-housing residents studying, job hunting and staying connected;
- employment-service participants;
- family/domestic-violence support;
- flood-affected communities;
- community laptop libraries.

Good360's current device flow is donor -> secure wipe/test/refurbish -> vetted charity/school -> final user, sometimes with connectivity and digital skills support.

The newer National Device Bank, led by WorkVentures with Good360 and Good Things Australia, formalises that same model nationally: secure collection, Blancco/NIST-grade sanitisation, repair/refurbishment, Windows/base-software setup where appropriate, distribution through community organisations, and ongoing support/digital-literacy assistance.

Evidence limit: no public source proves that all or most of Sircel's 2,350 FY2023-24 reused assets went to Good360/NDB. Sircel does not disclose its full reuse-partner or approved-broker list, and its ESG report explicitly says visibility ends after partner handoff.
